

AI Log - Sprint 1

Responsible Person: Yacine Zribi | AI Tool: OpenAI Codex

Task 1: Standardizing navigation headers

Purpose of AI Use: Coding and explaining a shared header design.

Chat Link: This Codex project conversation. A public share link has not been added.

AI-Suggested Content: Created shared header.css and updated the Home, Login, Register, Job Seeker Dashboard, and Recruiter Dashboard pages to use consistent header markup and styling.

Validation: I checked the pages in the browser and confirmed the headers looked consistent.

Decision: Accepted the changes and committed them through the header-standardization PR.

Reflection: AI helped reduce repeated styling and explained how a shared stylesheet affects multiple pages.

Responsible Person: Yacine Zribi

Task 2: Completing user login

Purpose of AI Use: Coding, debugging, and explaining authentication logic.

Chat Link: This Codex project conversation. A public share link has not been added.

AI-Suggested Content: Normalized email input, removed direct plain-text password comparison in favor of bcrypt.compare, checked required inputs and valid roles, used consistent invalid-credential messages, and retained session creation and role-based redirects. Added email normalization in login.js and corrected the registration link.

Validation: Registration and login flows for both roles, dashboard access, and logout were tested against MongoDB Atlas during the workflow. I also checked the application manually in the browser. Freddy reviewed the PR and refined frontend validation and error handling.

Decision: Accepted the core implementation, integrated teammate review changes, and merged PR #23 into develop.

Reflection: AI generated much of the implementation. I needed additional explanations to understand the code, particularly bcrypt, sessions, form submission, and role-based redirects.

Responsible Person: Yacine Zribi

Task 3: Registration validation and integration

Purpose of AI Use: Coding input checks and integrating overlapping team changes.

Chat Link: This Codex project conversation. A public share link has not been added.

AI-Suggested Content: Initially added required-field checks, email normalization, password confirmation, terms acceptance, role validation, and duplicate-email handling. Later integrated Baha's registration implementation from develop while preserving the login work.

Validation: Reviewed the combined changes and tested registration and login together as part of the authentication workflow.

Decision: Partially accepted and adapted. Baha's registration implementation took priority; my initial validation was not all retained.

Reflection: Working on linked features caused overlapping edits. Team coordination and building on the agreed registration implementation helped avoid keeping competing versions.

Responsible Person: Yacine Zribi

Task 4: Reviewing the user profile PR

Purpose of AI Use: Code review and explaining potential bugs.

Chat Link: This Codex project conversation. A public share link has not been added.

AI-Suggested Content: Identified missing session protection on the profile page and an incorrect ObjectId reference in image deletion. Suggested review comments, then checked Emma's follow-up changes. A local check confirmed that Types.ObjectId requires new in the installed Mongoose version.

Validation: I manually checked the profile flow. Codex inspected the code and tested the ObjectId constructor separately; this was not a complete automated test of the profile feature.

Decision: Used the findings to write review comments. Profile implementation remains Emma's contribution.

Reflection: A page can appear to work while an error is caught silently. AI review helped identify an image-cleanup issue that ordinary browsing could miss.
