

Great job getting ngrok running smoothly! You have successfully forwarded port **3306**.

However, looking at the notes you compiled, there are **two critical configuration errors** regarding the database ports that will cause your teammates' applications to crash if not adjusted.

Here is exactly how to fix those two details in the .env and server.js setup.

Error 1: Do not mix the Host and Port in .env

In your notes, you wrote `DB_HOST=4.tcp.ngrok.io:24494`. The mysql2 driver cannot parse a port number inside the host field like that. It needs to be separated into two distinct properties.

The Correct .env Setup

Your .env file remains exactly like this:

```
DB_HOST=127.0.0.1
DB_USER=root
DB_PASSWORD=
DB_NAME=careerConnect_db
DB_PORT=3306
```

Your **TEAMMATES'** .env files must look like this:

```
DB_HOST=4.tcp.ngrok.io
DB_USER=project_team
DB_PASSWORD=THE_PASSWORD_YOU_CREATED
DB_NAME=careerConnect_db
DB_PORT=24494
```

(Notice that `DB_PORT` is separated and set to **24494**, which is the unique external port ngrok assigned to you today).

Error 2: Keep the application port at 3000

In your notes, you mentioned *"My teammates will have `const port = 3306;` (in server.js file)"*.

This will cause an error. The `const port = 3000;` variable controls your **Express web server application**, not the database.

- Port 3000 is where the website runs.
- Port 3306 is reserved for MySQL.

Both you and your teammates should keep `const port = 3000;` exactly the same in `server.js`.

The Final server.js Fix

To support the custom ngrok database port, you just need to pass `process.env.DB_PORT` into your `mysql.createConnection` block.

Update your code block to match this perfectly:

```
// Load environment variables at the very top of your file
require('dotenv').config();
const bcrypt = require('bcrypt');
const express = require("express");
const mysql = require("mysql2");
const path = require('path');
const app = express();

const hostname = '0.0.0.0';
const port = 3000; // Leave this at 3000 for everyone so your
website runs smoothly!

// Parse form data
app.use(express.urlencoded({extended:true}));

// static files
app.use(express.static(path.join(__dirname, '..', 'css')));

// Connect to DB (UPDATED TO INCLUDE THE PORT PARAMETER)
const db = mysql.createConnection({
  host: process.env.DB_HOST,
  user: process.env.DB_USER,
  password: process.env.DB_PASSWORD,
  database: process.env.DB_NAME,
  port: process.env.DB_PORT || 3306 // Uses the .env port,
defaults to 3306 if missing
});
```

```
db.connect((err)=>{
  if(err){
    console.error("Database connection failed:", err);
  }
  else{
    console.log(`Connected to database:
${process.env.DB_NAME}`);
  }
});
```

Would you like help testing the connection, or do you need assistance configuring **git/GitHub** to make sure your teammates don't accidentally upload and overwrite each other's private .env files?
